Mural Design for Frisco Adventure Park

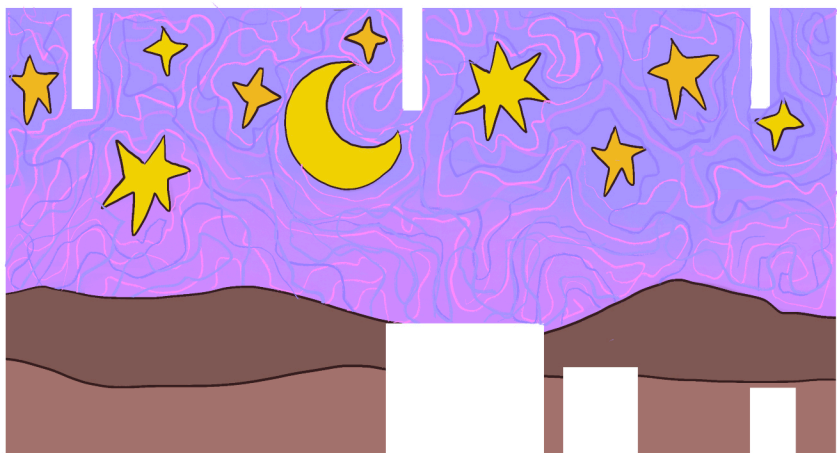

About the Design

Keystone Species are animals who play an incredibly essential role in their surrounding ecosystem. If they are removed, the ecosystem will collapse. In Colorado we have several keystone species, including the elusive and often misunderstood Mountain Lion.

As an apex predator, the presence of Mountain Lions keeps other wildlife on the move - this means they don't overgraze vulnerable plants, which ensures that river and stream habitats are safe from erosion and remain healthy to support many other flora and fauna, including songbirds and wildflowers.

This mural focuses on a mother mountain lion and two cubs at dusk. In the mother's body is a panoramic scene of the Dillon Reservoir. In the cubs bodies, one has wildflowers and the other has songbirds flying among clouds and a blue sky. The scenes within each lion's body are meaningful as they show aspects of the Colorado ecosystem that are dependent on mountain lions to thrive.

MURAL PROPOSAL

RUBEN CARRASCO

VISUAL ARTIST

PROPOSAL ADVENTURE PARK MURAL

The building features four walls, each with its own distinct characteristics. In response to these differences, I chose to create four individual murals, each dedicated to a local wildlife species. The animals are portrayed as monumental head-focused portraits, allowing the scale to deliver a strong and impactful visual presence on every façade.

Having one species per wall brings movement and dynamism to the structure, encouraging visitors to explore all four sides of the building. The visual connection between the murals is created through accompanying bird silhouettes, which add rhythm and continuity, as well as through wood-toned vegetation motifs inspired by the building's existing material.

The color palette was selected to maintain visual coherence with the natural environment and with the changing seasons of the Adventure Park landscape. Together, the four murals transform the building into a unified tribute to local fauna, offering a contemporary and engaging experience for visitors.

SOUTH WALL

The color palette of the vegetation will feature a warm range of brown tones.

This selection has been specifically curated to seamlessly blend with the natural hues of the wood and the oxidized elements of the structure.

EAST WALL

The lighting and contrast of this image have been adapted to preserve the natural light of the original photograph.

NORTH WALL

The lighting and contrast of this image have been adapted to preserve the natural light of the original photograph.

WEST WALL

The lighting and contrast of this image have been adapted to preserve the natural light of the original photograph for this catalog.

The colors shown in this sketch have been adapted to match the specific tones of the original photograph. Please note that the final colors will be uniform and tailored to seamlessly integrate with the building's structural elements.
